PRISM trial project

Reviewer guide and five-minute walkthrough

Developed by Sutanu Chatterjee (Trial Task for PRISM)

Built for Prism's research analysts and product team, this NTPC dashboard tests early operating signals and adds financial context. It fits Prism's financial and alternative-data intelligence work through transparent quantitative evaluation and source-linked natural-language answers.

Most useful output

The Investment decision view is a source-backed research brief: a watchlist assessment, the financial reasons behind it, and an editable entry-price screen. It helps an analyst identify what evidence would strengthen an investment case.

Suggested five-minute review

Time	View	What to inspect
0:00–1:30	Investment decision	Read the research brief, cash risks and valuation screen. Change an assumption.
1:30–3:00	Historical evaluation	Compare errors with the seasonal baseline. Open a quarter audit and try another cutoff.
3:00–3:45	Methodology	Follow the two-stream flowchart and the forecast/scoring boundary.
3:45–4:30	Prismy	Ask a preset question and an unsupported question.
4:30–5:00	Evidence library	Open an original report and inspect its provenance.

Three findings worth discussing

Generation: day-60 MAPE is 1.50% versus 2.20% for the seasonal-profile baseline, with wins in 5 of 8 quarters. Remaining-output errors are 3.81% versus 5.54%.

Cash: FY26 cash after gross capex is ₹6,852 crore before financing interest. Subtracting cash interest leaves −₹10,686 crore. The selected bridge excludes other investing and financing flows.

Valuation: the dated ₹303.75 close implies 10.61× reported TTM earnings. The illustrative 15% haircut, 12× fair P/E and 15% safety margin imply a ₹248.22 entry threshold.

Reproduction and handoff

What is included

PRISM-NTPC-Trial-Project.pptx: 8 concise editable slides with task alignment, charts, financial findings, sources in speaker notes and next steps.
PRISM-NTPC-Trial-Project.pdf: the same presentation for easy review.
Reviewer-Guide.pdf: this walkthrough.
NTPC-Research-Flowchart.png / .svg: current workflow, including a transparent PNG.
NTPC-Generation-Monitor-GitHub.zip: reproducible source, data, documents and tests.
Submission-Email.txt: a prepared draft for the applicant to send.

Run locally

Requires Node.js 20.10+; Node 24 is recommended. Extract the source ZIP or clone the repository, then open its root folder.

npm install
npm test
npm run dev

For a production build, run **npm run build**. The project includes 28 automated tests and a GitHub Pages workflow. Original public reports and source fingerprints are preserved in the repository.

What Prismy does

The hosted bot uses instant question matching and fixed, source-linked evidence cards. Its optional local Ollama mode routes paraphrases to allowed card IDs. Model-written financial prose is never displayed. Each question is independent. Answers use the fixed site dataset rather than unsent filter or worksheet changes.

Dates and limits

Overview retains Q3 FY26. The historical study covers Q1 FY25 through Q4 FY26 for eight selected thermal stations. Financials include FY25/FY26 audited results and the June 2026 quarter. Cash flow and full balance details are March 2026; the market quote is 28 October 2026.

Publication dates are proxies rather than verified first-seen timestamps. The sample does not represent all NTPC generation. Small-sample accuracy does not establish durable model skill or stock returns. Reported EPS includes tax and regulatory effects; the valuation assumptions are illustrative.

What I would improve next

Verify historical publication vintages; broaden station and entity mapping; reserve prospective holdout quarters; model recurring earnings, tariffs, project returns and funding; and evaluate the assistant on a larger question set.

The README contains detailed formulas, source definitions, comparability notes and the original brief-to-project mapping.
